

John is a designer. He notices that an application he regularly uses for work has an update.

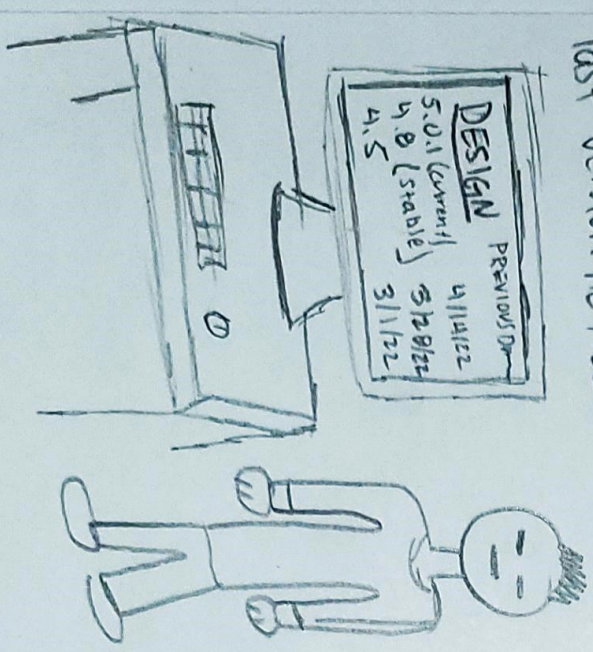

John proceeds to install the new update.

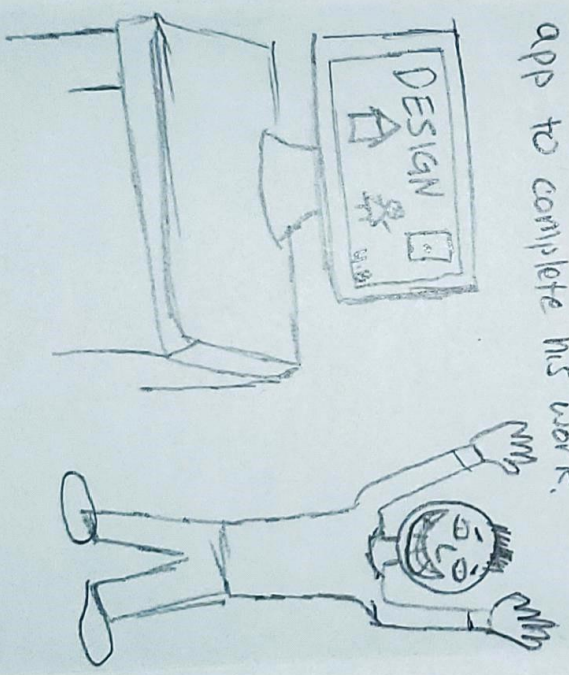

A bug prevents the app from starting correctly. John is furious since he needs to finish his work tonight.

John goes to "Previous Versions" on the app page and installs the last version he had.

John is happy that he was able to use a previous version of the app to complete his work.

There are many people who rely heavily on applications for their livelihood. If an update is pushed that has bugs, it can be frustrating or impossible to use. Downloading the version the users want allows them to continue their workflow.
